

Building Your Image

To build your Docker image, make sure you are building within the same directory as your Dockerfile.

```
docker build -t myusername/myimage:tag .
```

Multi-platform builds, with multiple tags, and auto-push:

```
docker buildx build --push \  
--platform linux/arm/v7,linux/arm64/v8,linux/amd64 \  
--tag your-username/package:versionNum \  
--tag your-username/package:latest .
```

If you just need to re-build the project due to updated dependencies, and don't want Docker to use the pre-cached steps of the build process, use `--no-cache` in the build command.
